- 1 Summary of Soil Analytical Data, Shallow and Deep Soils Investigations, Lakeland Terminal Property, Powerine Oil Company, Santa Fe Springs, California

Introduction

Powerine Oil Company (POC) recently (January 1997) completed a deep soils investigation at the Administrative Building Property (Lakeland Property; 12345 Lakeland Road) situated south of the Powerine Refinery, Santa Fe Springs, California (Figure 1). The assessment consisted of the installation of seven soil borings at the site drilled to an average depth of 75 feet below ground surface (ft-bgs). This assessment supplements a previous investigation conducted at the facility in November 1996, during which 29 soil borings were drilled to an average depth of 22 ft-bgs using a Geoprobe sampling rig.

During the previous November investigation, the Geoprobe rig had met refusal at several of the boreholes at the Lakeland Property at approximately 20 feet below ground surface. In many of these cases, field screening and analytical laboratory data indicated that petroleum constituents were present at the total depth of the boreholes. In January 1997, a hollow-stem auger drill rig equipped with a split spoon sampling assemblage was used to collect deeper soil samples for analysis in order to complete vertical definition of subsurface soils impacts.

The purpose of the deep soils investigation was to delineate vertical extent of soil impacts in several areas of the facility. Powerine collected additional soils data during this investigation to use in the preparation of a risk assessment for the site. Soil analyses were collected pursuant to Powerine's Regional Water Quality Control Board (RWQCB) approved Workplans dated November 7, 1996 and November 14, 1996. RWQCB correspondence dated November 14, 1996 approved investigative methods for this property.

Property Use

The Lakeland Property consists of approximately 13 acres which has historically been used as Administrative Building employee parking and to store refined petroleum products. The property has been divided into ten areas, grouped by known current and past property uses. These areas are depicted on Figure 2. Detailed descriptions of past and current property uses were described in the December 17, 1996 report, "Soils Investigation, Administrative Building/Lakeland Property, 12354 Lakeland Road, Santa Fe Springs, California," prepared by TriHydro Corporation.

Regional and Site Hydrogeology

The Lakeland Property is underlain by interbedded lenses of silty clays to clayey silts, silts to sandy silts, and silty sands to sands. The uppermost layer underlying the site consists of silty clay and clayey silt ranging in thickness from four feet to 30 feet. These unconsolidated units slope gently to the southwest. Finer-grained sediments are typically more prevalent on the western part of the property, while coarser grained sediments are found along the eastern portion of the property.

The uppermost water bearing unit underlying the property is the Exposition Aquifer of the Lakewood Formation. The Exposition Aquifer is the hydrogeologic equivalent to the Artesia Aquifer, which is encountered south of the Lakeland Property. The Exposition is comprised of lenticular beds of permeable coarse gravels and less permeable, finer grained sediments and clays. An unnamed aquiclude separates the Exposition from underlying water-bearing horizons.

A more detailed discussion of the regional and site hydrogeology summarized from the California Department of Water Resources, Bulletin No. 104, and based in part on Powerine's well logs, was provided in the RWQCB approved workplan dated November 7, 1996.

Groundwater Conditions

Powerine Oil Company's (POC) groundwater monitoring well network consists of 23 wells located on and near the Lakeland Property. Powerine has been measuring fluid levels and monitoring groundwater quality at the facility (including the Administrative Building/Lakeland Property) since June 1988. The most recent groundwater monitoring event was conducted in December 1996.

Groundwater Flow Directions

Recent and historical groundwater elevation data are summarized in Table A-1 of Appendix A. Groundwater flow directions at the facility have consistently been to the south over the past eight years. Since monitoring began, the hydraulic gradient under the refinery and adjacent properties has ranged from 0.007 to 0.009 feet/foot. A groundwater elevation contour map based on the December 1996 fluid level measurements is provided on Figure 3, which reflects a hydraulic gradient of 0.008 feet/foot. The December 1995 groundwater elevation contour map is presented in Figure 4 for comparison.

Groundwater Quality

A summary of benzene, toluene, ethylbenzene, and total xylenes (BTEX) and total petroleum hydrocarbons as gasoline (TPH-G) concentrations detected in Powerine groundwater monitoring wells since 1988 is presented in Table A-2 of Appendix A. Isoconcentration maps for benzene and TPH-G based on the December 1996 monitoring event are shown on figures 5 and 6. For comparison, isoconcentration maps for these same two constituents based on the December 1995 monitoring event are provided in figures 7 and 8. Based on these figures and the analytical data presented in Table A-2, there has been only minimal variations in monitoring wells in which TPH-G and BTEX constituents have been detected over the past eight years.

Existing Soil Data

Soil data from the site has been obtained during the removal of three gasoline underground storage tanks, from borings created while installing wells MW-206, MW-501, MW-502, and MW-503, and from the shallow soils investigation conducted at the site in November, 1996. Figure 2 shows the locations of the wells and shallow soil borings. A summary of all known analytical soils data for the site is provided on Plate 1 of this report.

Soils Investigation Procedures

Seven additional boreholes were drilled to an average depth of 75 feet below ground surface during this investigation (Figure 2). Borings were drilled to a minimum depth of 70 ft-bgs (see borehole logs in Appendix B). Soil samples were collected and analyzed from each borehole. Drilling and sampling procedures and the results of the laboratory analyses are provided in the following sections.

Borehole Drilling

All of the boreholes were drilled by H.F. Drilling, Fullerton, California. Six of the boreholes were installed using a Failing F-10 hollow stem auger (HSA) drill rig and the remaining borehole was installed using a Mobile B-41 HSA rig. Borehole locations were selected by Powerine based on results of the previous shallow soils investigation and data requirements for the risk assessment. Prior to drilling at each borehole location, underground utilities were marked. Field personnel used a hand auger to verify that no underground conflicts were present.

Borehole locations are shown on Figure 2. The boreholes were drilled to an average depth of 75 feet below ground surface (ft-bgs). Lithologic descriptions for each borehole were recorded on log-of-borehole forms (included in Appendix B). All field activities were supervised by a California Registered Geologist.

Soil Sample Collection

Soil samples were collected at five foot intervals from each borehole using an 18-inch long, 2.5-inch diameter split spoon sampler, fitted with three 6-inch long brass liners. At three of the deep soil borings (PTR-3, PTR-4, and PTR-6) installed immediately adjacent to existing shallow boreholes (PT-3, PT-6, and PT-7, respectively), no soil samples were collected in the shallow subsurface.

After each sampled interval was brought to the surface, the brass liners containing the soil sample aliquots were removed from the sampler and handled as follows:

- The two bottom liners from each sampling interval were checked to ensure that they contained no headspace and then immediately capped with teflon sheeting and plastic end caps and placed on ice for possible laboratory analysis.

- An aliquot of soil from the remaining liner was placed into a sealed plastic bag for lithologic logging and soil gas headspace field screening.
- Lithology and soil gas headspace field screening results were recorded for each sample interval.
- One or two brass liners were submitted to the laboratory for analyses.

The plastic bag containing the soil sample for field screening and lithologic description was shaken to enhance volatilization and allowed to equilibrate to ambient temperature. Each soil sample was field screened by inserting the probe of a photoionization detector (PID) through a small hole in the plastic bag and measuring the headspace total organic vapor (TOV) concentrations. The PID was calibrated prior to use at the beginning of each day with a factory prepared 100 parts per million (ppm) isobutylene standard. The PID was checked at regular intervals throughout the investigation to ensure accurate TOV measurements.

The highest TOV field screening measurement was recorded for each sampled interval. The TOV concentrations are reported relative to the isobutylene standard. Borehole logs containing lithologic descriptions and TOV field screening results are provided in Appendix B. Table 1 summarizes TOV readings by depth for each borehole.

Equipment Decontamination

All downhole drilling and sampling equipment was decontaminated prior to use at each borehole and sampling interval. The samplers were scrubbed with a brush in a detergent and water wash and rinsed with water. All drilling equipment was steam cleaned. Decontamination water was contained in 55-gallon drums and transported to the refinery for disposal/recycling.

Borehole Abandonment/Soil Cuttings Disposal

At the completion of sampling activities, all boreholes were filled to ground surface with bentonite granules. All soils generated during drilling and sampling were placed in 55-gallon drums, labeled, and temporarily stored at the site pending appropriate handling by Powerine personnel.

Laboratory Analyses

Soil samples were submitted to State certified laboratories for analyses by the following EPA methods:

- Method 8015(m) -- Total Petroleum Hydrocarbons modified for the C₆-C₄₄₊ Range by Gas Chromatography
- Method 8020 -- Aromatic Volatile Organics by Gas Chromatography for Benzene, Toluene, Ethylbenzene, total Xylenes (BTEX), and MTBE

- Method 8260 -- Volatile Organic Compounds including MTBE by Gas Chromatography/Mass Spectrometry
- Method 8310 -- Polynuclear Aromatic Hydrocarbons by High Pressure Liquid Chromatography.

Not every sample was analyzed for every listed EPA Method. Table 2 summarizes the analyses completed on each of the submitted samples. In addition, several of the samples were submitted to a laboratory for the analysis of the following physical data for use in the risk assessment:

- Total organic content (by Walkley-Black)
- Dry bulk density (ASTM Method D2937)
- Porosity (ASTM Methods D2937/D854)
- Intrinsic Permeability (ASTM Method D5084)
- Moisture Content (ASTM Method D2216)

Lithology

Based on the borehole logs from this investigation (Appendix B), the Lakeland Property is underlain by a clayey silt/silty clay layer which ranges in thickness from 15 to 30 feet. This low permeable layer overlies a fine grained sand and silty sand layer which extends to groundwater. These silty sand units are interbedded with thin layers of clayey silt/silty clay. Based on the borehole logs provided in Appendix B, there appears to be a continuous clayey silt/silty clay layer ranging in thickness from less than 5 feet to greater than 10 feet under the loading rack and tank farm areas. The water bearing zone underlying the site is composed of a medium to coarse grained sand.

Soil Quality Analytical Results

Soil analyses by EPA Methods 8015 and 8020 were conducted by Jones Environmental Testing Laboratories, Fullerton, California, using an onsite mobile laboratory. The remaining organic analyses were conducted by BC Laboratories, Bakersfield, California. Laboratory quality assurance/quality control (QA/QC) data were reported by both laboratories to be within acceptable limits for the analytical methods performed. Analysis for the physical parameters were evaluated by Environmental GeoTech, Santa Fe Springs, California.

The soil analytical results are summarized on Plate 1. Previous site data are also included on Plate 1. Laboratory analytical reports are presented in Appendix C. Chain-of-custody forms for the submitted samples are included in Appendix D. Physical parameter results are not provided in this report, nor included on Plate 1, since these results will be submitted with Powerine's risk assessment.

Based on analytical data from the seven deep soil borings, hydrocarbon related soils impacts are present at depth in the vicinity of Area 1 (Loading Racks, Tanks, and Scales). Deep boreholes PTR-1, PTR-5, PTR-6, and PTR-7 appear to be located near the lateral extent of hydrocarbon impacted soil.

In PTR-2, total petroleum hydrocarbons (TPH) from C₆-C₄₄₊ were detected in concentrations ranging from non-detect (65 ft-bgs) to 27,000 mg/kg (45 ft-bgs). Benzene was detected in samples collected from this borehole in concentrations ranging from non-detect (65 ft-bgs) to 130 mg/kg (60 ft-bgs). TPH was detected in PTR-3 at concentrations ranging from 680 mg/kg (65 ft-bgs) to 14,500 mg/kg (30 ft-bgs); benzene ranged from 1.2 mg/kg (65 ft-bgs) to 200 mg/kg (30 ft-bgs). And in PTR-4, TPH ranged from 300 mg/kg (35 ft-bgs) to 870 mg/kg (45 ft-bgs) and benzene ranged from 0.46 mg/kg (65 ft-bgs) to 25 mg/kg (45 ft-bgs).

Depth to groundwater under the Lakeland Property is approximately 75 to 80 feet below ground surface. Based on routine groundwater sampling activities conducted by Powerine Oil Company, groundwater underlying the Lakeland Property is known to be impacted by petroleum hydrocarbons. As a result, soil impacts detected below approximately 65 to 70 feet below ground surface during the soils investigation at the Lakeland Property may be the result of groundwater table fluctuations.

Methyl-tertiary-butyl ether (MTBE) was detected during the EPA Method 8260 analyses of five of the samples from the vicinity of Area 1. The detected MTBE concentrations ranged from 0.05 mg/kg (PTR-7 55 ft-bgs) to 3.3 mg/kg (PTR-2 15 ft-bgs).

APPENDIX C
LABORATORY DATA SHEETS

BC LABORATORIES, INC.

January 20, 1997

LINDA BARNES
TRIHYDRO
920 SHERIDAN
LARAMIE, WY 82070

Subject: Laboratory Submission No.: 97-00301
Samples Received: 01/08/97

Dear LINDA BARNES

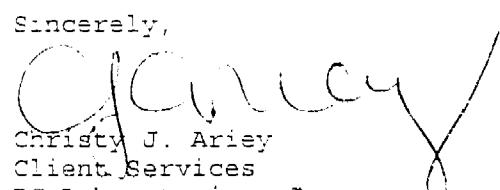

The samples(s) listed on the Chain of Custody report were received by BC Laboratories, Inc. on 01/08/97.

Enclosed please find the analytical data for the testing requested. A copy of the results for this submission will be sent to the following: POWERINE CRL CO. - MATT WINEFIELD. If you have any questions regarding this report please contact me at (805)327-4911, ext. 201.

Any unused sample will be stored on our premises for a minimum of 30 days (excluding bacteriologicals) at which time they will be disposed unless otherwise requested at the time of sample receipt. A disposal fee of \$5 per sample may apply for solid sample matrices.

Please refer to submission number 97-00301 when calling for assistance.

Sincerely,

Christy J. Ariey

Polynuclear Aromatic Hydrocarbons
(EPA Method 8310)

TRIHYDRO
920 SHERIDAN
LARAMIE, WY 82070
Attn: LINDA BARNES 307-745-7474

Date Reported: 01/17/97
Date Received: 01/08/97
Laboratory No.: 97-00301-1

Sample Description: LAKELAND: PTR1 1.5 - 2.0 SAMPLED BY LINDA BARNES

Sample Matrix: Soil Date Collected: 01/06/97
Date Extracted: 01/09/97
Date Analyzed: 01/17/97

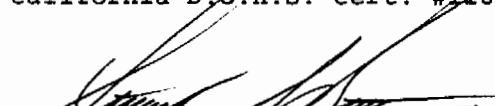

<u>Constituents</u>	<u>Analysis Results</u>	<u>Reporting Units</u>	<u>Practical Quantitation Limit</u>
Acenaphthene	None Detected	mg/kg	0.1
Acenaphthylene	None Detected	mg/kg	0.04
Anthracene	0.0016	mg/kg	0.0002
Benzo(a)anthracene	0.0017	mg/kg	0.0004
Benzo(a)pyrene	0.0020	mg/kg	0.002
Benzo(b)fluoranthene	0.0069	mg/kg	0.0007
Benzo(g h i)perylene	0.0040	mg/kg	0.004
Benzo(k)fluoranthene	0.0018	mg/kg	0.0007
Chrysene	None Detected	mg/kg	0.004
Dibenzo(a h)anthracene	0.0060	mg/kg	0.002
Fluoranthene	0.0078	mg/kg	0.002
Fluorene	None Detected	mg/kg	0.007
Iproto(1,2,3-c d)pyrene	0.0078	mg/kg	0.004
Naphthalene	None Detected	mg/kg	0.04
Phenanthrene	0.0033	mg/kg	0.0007
Pyrene	0.0076	mg/kg	0.002

Quality Control Data

<u>Surrogates</u>	<u>% Recovery</u>	<u>Control Limits</u>
Decafluorobiphenyl	91.	41-121

Note: PQL's were raised due to high concentration of target analytes requiring sample dilution.

California D.O.H.S. Cert. #1186

LABORATORY REPORT

Client:	Powerine Oil	Report Date:	01/08/97
Client Address:	P.O.Box 2108	JEL Ref. No.:	A-2625
	Santa Fe Springs, CA 90670	Client Ref. No.:	063-008
Attn:	Matt Winefield	Date Sampled:	01/06-07/97
		Date Received:	01/07/97
Project:	Powerine Lakeland Terminal	Date Analyzed:	01/07/97
Project Address:	Sante Fe Springs, CA	Physical State:	Soil

ANALYSES REQUESTED

1. EPA 8020 - Volatile Aromatic Hydrocarbons
2. Mod 8015 Diesel - Simulated Distillation Extended Range

Approval:

Steve Jones, Ph.D.
Laboratory Manager

* Samples will be held for a maximum of 30 days unless otherwise notified in writing. *
